

5 checks before you ship a new endpoint

A generic example carousel.

Swipe ->

Validate the input

Reject bad data at the edge.

Never trust the client.

```
validate($request, $rules);
```

2 OF 2

Set a timeout

Every outbound call needs a deadline.

```
Http::timeout(5)->get($url);
```

Retry blindly vs retry on purpose

Blind

- Retries everything
- Doubles the load in an outage

On purpose

- Retries safe errors only
- Backs off and gives up

Save this for your next code review

Do you block a merge for a missing timeout, or just comment on it?
